

# KeikiPro®

A revolutionary combination of phyto-hormones for activating dormant orchid tissues

KeikiPro is non flammable, non carcinogenic, non hazardous, and non toxic. The liquid concentrate can be mildly caustic if it is inhaled, sprayed in eyes, or contacts skin. Remember when handling any chemical to always use proper protection: (gloves, masks etc.) Do not use KeikiPro in combination with any other products containing phyto-hormones

For direct stimulation of individual dormant nodes:

Carefully (using a toothpick or similar tool) loosen the protective bract covering the node(s) you want to treat. Apply one drop of KeikiPro to the node(s). Wait 24hrs. Then resume normal care and watering of your plant.

(mixture should be used within 48 hrs.)

This is the preferred method of application, when not treating individual nodes. Mix KeikiPro at a rate of 2-4 drops per ounce of water. This mixture can be applied or sprayed to any part of the plant where growth can occur, i.e. inflorescences, roots, stems etc. Wait 24 hrs. Then resume normal care and watering of your plant.

Use the following guidelines for various types of growth results.

**Aerial keikis:**

Treat nodes when blooming is complete and new growth has started.

**Basal keikis:**

Treat the growth stem when in active new growth.

**Multiple inflorescences:**

Treat growth stem when spiking begins.

**Branching inflorescences:**

Treat nodes while buds are present or forming.

**Multiple growths (pseudo-bulb types)**

Treat (spray) back bulbs or dormant back 'eyes' when a new lead is currently active.

**Storage and clean up:**

Do not refrigerate KeikiPro. The liquid concentrate has an indefinite shelf life when stored at average room temperatures. Clean up with basic soap and water solution.
